The app.py dependency graph includes custom modules and external packages. Custom modules include query_data and create_table. External packages include Flask, Werkzeug, jinja2, psycopg2 – exactly what I used to build the Flask application with blueprints and templates. Arrows depict dependencies between the modules. Thus, one can notice that query_data depends on the psycopg2 package and create_table module. Flask itself has lots of dependencies that can be visually seen and assessed thanks to the graph.
